## Features

- Variable axial piston pump with tapered piston rotary group in bent axis design for hydrostatic drives in open circuits
- For operation in mobile and industrial applications
- The flow is proportional to the drive speed and the displacement and steplessly variable from  $q_{v \max}$  to  $q_{v \min} = 0$
- Wide range of controls and adjustment devices
- Compact, robust bearing system for long service life
- Available with Long Life bearings for special fluids and extreme service life requirements
- Pressure control is standard
- Optical or electric swivel angle indicator available

# Technical data

## Hydraulic fluid

The variable pump A7VO is not suitable for operation on HFA fluids. When operating on HFD or ecologically acceptable fluids, limitations to the technical data and seals must be observed.

For the sizes 250 and 355 with **operation on HFC-fluids**, the **A4VSO..F** must be used. For certain selected HFC fluids the same pressures and speeds are permissible as for operation on mineral oil.

When ordering, state the fluid to be used in clear text.

### Operating viscosity range

In order to obtain optimum efficiency and service life, we recommend that the operating viscosity (at operating temperature) be selected in the range

$$v_{\text{opt}} = \text{opt. viscosity range } 16 \dots 36 \text{ mm}^2/\text{s}$$

referred to tank temperature (open circuit).

### Limit of viscosity range

For critical operating conditions the following values apply:

$$v_{\text{min}} = 10 \text{ mm}^2/\text{s} \text{ for short periods (} t < 3 \text{ min) at max. permissible case drain temperature } t_{\text{max}} = +90^\circ\text{C.}$$

$$v_{\text{max}} = 1000 \text{ mm}^2/\text{s} \text{ for short periods (on cold start maximum operating viscosity of } 100 \text{ mm}^2/\text{s should be reached within 15 min) } t_{\text{min}} = -25^\circ\text{C}$$

Note, that the maximum fluid temperature of 90°C may not be exceeded at any point (e.g. around the bearings). The fluid temperature in the bearing area is influenced by drive speed and pressure, and is typically 12 K higher than the average case drain temperature.

### Temperature range

(see selection diagram)

$$t_{\text{min}} = -25^\circ\text{C}$$

$$t_{\text{max}} = +90^\circ\text{C}$$

### Selection diagram

### Notes on the selection of hydraulic fluids

In order to select the correct fluid, it is necessary to know the operating temperature in the tank (open circuit) in relation to the ambient temperature.

The hydraulic fluid should be selected so that within the operating temperature range, the viscosity lies within the optimum range ( $v_{\text{opt}}$ ) see shaded section in the selection diagram. We recommend, that the higher viscosity grade is selected in each case.

Example: at an ambient temperature of  $X^\circ\text{C}$  the operating temperature in the tank is 60°C. In the optimum viscosity range ( $v_{\text{opt}}$ ; shaded area), this corresponds to grades VG 46 or VG 68; select: VG 68.

### Important:

The case drain temperature is influenced by pressure and speed and is always higher than the tank temperature. However the max. temperature at any point in the system may not exceed 90°C.

If the above conditions cannot be met, due to extreme operating parameters we recommend a housing flushing via port U.

### Filtration

The finer the filtration, the better the achieved cleanliness of the fluid and the longer the life of the axial piston pump.

To ensure a reliable functioning of the axial piston unit, a minimum cleanliness class of

20/18/15 acc. to ISO 4406 is necessary.

# Technical data

## Operating pressure range

Depending on the operating fluid, limitations may apply, see the chapter on hydraulic fluids, page 4.

### Pressure at the outlet ports (pressure ports) A or B

Nominal pressure  $p_{nom}$  \_\_\_\_\_ 350 bar absolute

Peak pressure  $p_{max}$  \_\_\_\_\_ 400 bar absolute

Total operating period \_\_\_\_\_ 300 h

Individual operating period \_\_\_\_\_ 1 s

Minimum pressure (in pump outlet) \_\_\_\_\_ 10 bar

For a lower pressure, please consult us.

Rate of pressure change  $R_A$  \_\_\_\_\_ 16000 bar/s

Under pulsating load conditions above 315 bar we recommend the use of a splined shaft (to DIN 5480).

### Pressure at the inlet port S (Suction)

Minimum inlet pressure  $p_{S min}$  \_\_\_\_\_ 0.8 bar absolute

Maximum inlet pressure  $p_{S max}$  \_\_\_\_\_ 8 bar absolute

### Minimum inlet pressure

In order to avoid damage to the axial piston pump a certain minimum inlet pressure at the pump's suction port S is necessary. This minimum inlet pressure is dependent on the drive speed and the displacement of the axial piston unit.

### Note

- Maximum speed  $n_{max}$   
(Speed limit, see table of values, page 8)
- Minimum and maximum pressure at port S
- Permissible values for the shaft seal  
(see diagram on page 7)

An increase in inlet pressure results in a higher control begin of the LR-control curve as well as a rise of the LR.H- and LR.N-pilot pressure characteristics.

Factory setting of the control begin is done at an inlet pressure  $p_s = 1$  bar absolute.

Exact details of the shifts in the control curves on request.

## Definition

### Nominal pressure $p_{nom}$

The nominal pressure corresponds to the maximum design pressure.

### Peak pressure $p_{max}$

The peak pressure corresponds to the maximum pressure within the individual operating period. The total of the individual operating periods must not exceed the total operating period.

### Minimum pressure (in pump outlet)

Minimum pressure in the pump outlet side (port A or B) that is required in order to prevent damage to the axial piston unit.

### Rate of pressure change $R_A$

Maximum permissible pressure build-up and pressure reduction speed with a pressure change over the entire pressure range.

Total operating period =  $t_1 + t_2 + \dots + t_n$

## Direction of flow

Direction of rotation, with view on shaft end	
clockwise	counter clockwise
<b>S to B</b>	<b>S to A</b>

## Technical data

### Long-Life-Bearings (L)

For long service life requirements and when using HFD-fluids. Identical external dimensions as units with standard bearings. A retroactive conversion to Long-Life Bearings is possible. It is recommended, that the bearings and housing be flushed via port U.

### Bearing flushing

#### Flushing flows (recommended)

NG	250	355	500
$q_{\text{flow}}$ (L/min)	10	16	16

### Operation in standby (in pressure control mode)

Operation in standby, without external flushing via port U is only permissible for short periods:

A7VO maximum 15 min at 200 bar  
3 min at 350 bar

HA7VO maximum 5 min at 200 bar  
1 min at 350 bar

For other pressure levels information on request

Influence of drive speed can be neglected

At tank temperature  $\leq 50^{\circ}\text{C}$

For longer periods of standby operation it is necessary to implement housing flushing via port U.

Flushing flows for A7VO same as bearing flushing

#### Flushing flows HA7VO (High-Speed-version)

# Technical data

## Shaft seal FKM (Fluoro-rubber)

### Permissible case pressure

The service life of the shaft seal is influenced by pump drive speed and case pressure. It is recommended not to exceed the continuous averaged case pressure of 3 bar abs. (max. perm. case pressure 4 bar abs. at reduced speed, see diagram).

The case pressure must be equal to or higher than the external pressure on the shaft seal (in case of the standard version). For the High-Speed-version please consult us.

Special operating conditions may make it necessary to restrict these values .

### Important:

- maximum permissible drive speed of variable pump (see table of values, page 8)
- max. permissible case pressure  $p_{s,max}$  4 bar
- an increase in case pressure results in a higher control begin of the **HD**- and **DR**- controls.

Exact details of the shift in control characteristics on request.

Factory setting of the control begin at  $p_s = 1$  bar.

### Temperature range

The FKM shaft seal is suitable for case temperatures of -25° C to +90° C.

## Technical data

**Table of values** (theoretical values, without considering  $\eta_{mh}$  and  $\eta_v$ ; values rounded off)

Size	NG		250	250H	355	500	
	High-Speed-Version						
Displacement	$V_{g \max}^{1)}$	cm <sup>3</sup>	250	250	355	500	
	$V_{g \min}^{1)}$	cm <sup>3</sup>	0	0	0	0	
Speed maximum <sup>2)4)</sup>	at $V_{g \max}$	$n_{nom}$	rpm	1500	1800	1320	1200
Speed maximum <sup>3)4)</sup>	at $V_g \leq V_{g \max}$	$n_{max}$	rpm	1800	–	1600	1500
Maximum flow <sup>4)</sup>	at $n_{nom}$ ( $V_{g \max}$ )	$q_{v \max \text{ nom}}$	L /min	375	450	469	600
Maximum power <sup>4)</sup>	at $q_{v \text{ nom}}$ and $\Delta p = 350$ bar	$P_{nom}$	kW	219	262	273	350
Torque <sup>4)</sup>	at $V_{g \max}$ and $\Delta p = 350$ bar (continuous operation)	$T_{max}$	Nm	1391	1391	1978	2785
Rotary stiffness	$V_{g \max}$ to $0.5 \cdot V_{g \max}$	$c_{min}$	Nm/rad	59500	59500	74800	115000
	$0.5 \cdot V_{g \max}$ to $0_{(interpolated)}$	$c_{max}$	Nm/rad	181000	181000	262000	391000
Moment of inertia rotary group		$J_{TW}$	kgm <sup>2</sup>	0.061	0.061	0.102	0.178
Angular acceleration maximum		$\alpha$	rad/s <sup>2</sup>	10000	10000	8300	5500
Case volume		$V$	L	3	3	5	7
Weight approx.		$m$	kg	102	102	173	234

<sup>1)</sup> Standard setting for limitation of the swivel angle. If another setting is required, please state in clear text.

Setting range  $V_{g \max}$ :  $V_{g \max}$  to  $0.8 \cdot V_{g \max}$

$V_{g \min}$ : 0 to  $0.2 \cdot V_{g \max}$

<sup>2)</sup> Nominal speed in self priming operation with an absolute pressure ( $p_s$ ) of 1 bar at inlet port S and mineral oil with a density of 0,88 kg/L

<sup>3)</sup> The values apply for  $V_g \leq V_{g \max}$  or an increase in inlet pressure  $p_s$  at the inlet port S (see diagram page 5)

<sup>4)</sup> Depending on the type of fluid, restrictions may be necessary, see chapter hydraulic fluids page 4

### Important

Exceeding the maximum or falling below the minimum permissible values can lead to a loss of function, a reduction in operational service life or total destruction of the axial piston unit. More details on limiting values for speed fluctuations, reduction in angular acceleration dependent on the frequency and the permissible starting angular acceleration (below the maximum angular acceleration) can be found in data sheet

### Determination of size

$$\text{Flow} \quad q_v = \frac{V_g \cdot n \cdot \eta_v}{1000} \quad [\text{L/min}]$$

$$\text{Drive torque} \quad T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} \quad [\text{Nm}]$$

$$\text{Power} \quad P = \frac{2\pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p}{600 \cdot \eta_t} \quad [\text{kW}]$$

$V_g$  = Geometr. displacement per revolution in cm<sup>3</sup>

$\Delta p$  = Differential pressure in bar

$n$  = Speed in rpm

$\eta_v$  = Volumetric efficiency

$\eta_{mh}$  = Mechanical-hydraulic efficiency

$\eta_t$  = Overall efficiency ( $\eta_t = \eta_v \cdot \eta_{mh}$ )

# Technical data

## Permissible radial and axial forces on the drive shaft

Size	NG	250	355	500
Radial force, maximum <sup>1)</sup> (at $p_{A,B} = 1 \text{ bar}$ )	 $F_{q \max}$ N	1200	1500	1900
Axial force, maximum <sup>2)</sup> (at $p_{A,B} = 1 \text{ bar}$ )	 $+ F_{ax \max}$ N $- F_{ax \max}$ N	4000 1200	5000 1500	6250 1900

<sup>1)</sup> When at standstill or pressureless circulation of the axial piston unit. Under pressurized condition higher forces are permissible, please consult us

<sup>2)</sup> Maximum permissible axial force at standstill or pressureless circulation of the axial piston unit

Regarding the permissible axial force, the direction of the force must be taken into consideration:

$- F_{ax \max}$  = increase of bearing life

$+ F_{ax \max}$  = decrease of bearing life

### Influence of the radial force $F_q$ on the bearing life

Through a favourable direction of the actuating radial force  $F_q$ , the internal load on the bearings can be compensated for and in this manner an optimum on bearing life can be obtained, please consult us.

# DR Pressure control

**Initial position:**  $V_{g\ max}$  in pressureless condition

The pressure control limits the maximum pump output pressure within the control range of the pump. This max. pressure level can be set at the integrated control valve. When reaching this preset level, the pump destrokes and supplies only the amount of flow as needed by the users (actuators).

**Setting range of the pressure control** \_\_\_\_\_ 50 to 350 bar  
Standard setting is 350 bar.

If another setting is required please state in clear text.

## Important

- A recommended main line relief valve in the system to safeguard against excessive pressure spikes must have a cracking pressure at least 20 bar above the DR control setting.
- The control begin and the DR-control characteristic is influenced by housing pressure. An increase in housing pressure results in a higher control begin and thus a parallel shifting of the control curve (see page 7).
- Operation in standby see page 6.

## Characteristic

# DRG Pressure control remotely adjustable

**Initial position:**  $V_{g \max}$  in pressureless condition

In order to obtain a remote adjustment of the pressure control level a separate pilot pressure relief (item 2) valve must be connected to port  $X_3$ . This relief valve is not included in the supply of the DRG control.

Setting range of the pressure control \_\_\_\_\_ 50 to 350 bar

The spring force on the pressure compensator spool causes a differential pressure between pump output pressure and pressure at  $X_3$  (as soon as the relief valve opens and the pressure control function takes place). Standard setting of this differential pressure 25 bar.

As long as the the pressure is below the set pressure of the relief valve, the pressures on both sides of the pressure compensator spool are equal and the additional spring force keeps this spool in a shifted position (Spool in equilibrium).

As soon as the set pressure of the relief valve is reached, this valve will start to open and the pilot flow will result in a differential pressure over the compensator spool, which causes this spool to shift and brings the pump to a smaller displacement.

$V_{g \min}$

The differential pressure at the pressure compensator spool (item 1) is normally set at 25 bar, which results in a pilot flow at  $X_3$  of approx. 2 L/min.

In case another setting (range 14 to 50 bar) is required, please state in clear text when ordering.

As a separate pilot relief valve we recommend:

DBD 6 (hydraulic)

DBETR-SO 437 with dampened spool (electric)

The max. line length should not exceed 2 m.

## Note

– The beginning of control and the DRG control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic.

– Standby operation see page 6.

O = Must be connected (closed on delivery)

X = Plugged (in normal operation)

# LR<sub>D</sub> Power control with integrated pressure control

**Initial position:**  $V_{g \max}$  in pressureless condition

## Power control

The power control adjusts the pump displacement in relation to the operating pressure in such a manner, that a given drive power at constant drive speed is not exceeded.

$$p_B \cdot V_g = \text{constant (drive power)}$$

$p_B$  = operating pressure;  $V_g$  = displacement

This precise control along the hyperbolic control characteristic permits an optimum utilisation of drive power.

The operating pressure acts on a lever mechanism via the measuring spool in the displacement control piston. It is offset by the externally set spring force which acts on the pilot valve and determines the power setting.

When the operating pressure exceeds the set spring force, the power control pilot valve is actuated via the lever mechanism and the pump swivel towards a smaller displacement  $V_{g \min}$ . This in turn reduces the effective moment on the lever mechanism and the operating pressure can increase in the same ratio by which the pump output flow is reduced, without exceeding the installed drive power ( $p_B \cdot V_g = \text{constant}$ ).

Setting range for the control begin of the power control from \_\_\_\_\_ 50 to 300 bar.

### Note

- The control begin and the LR-power control characteristic are influenced by pump inlet pressure. An increase in pump inlet pressure results in a higher control begin (see page 5) and thus a parallel shift of the control characteristic.
- The hydraulic output power (LR-characteristic) is influenced by pump efficiency

### When ordering please state in clear text:

X = Plugged (in normal operation)

# LRG with remotely adjustable pressure control

**Initial position:**  $V_{g\ max}$  in pressureless condition

The remotely adjustable pressure control overrides the power control.

In order to obtain a remote adjustment of the pressure control level a separate pilot pressure relief (item 2) valve must be connected to port  $X_3$ . This relief valve is not included in the supply of the DRG control.

Setting range of the pressure control \_\_\_\_\_ 50 to 350 bar

The spring force on the pressure compensator spool causes a differential pressure between pump output pressure and pressure at  $X_3$  (as soon as the relief valve opens and the pressure control function takes place). Standard setting of this differential pressure 25 bar.

As long as the the pressure is below the set pressure of the relief valve, the pressures on both sides of the pressure compensator spool are equal and the additional spring force keeps this spool in a shifted position (Spool in equilibrium).

As soon as the set pressure of the relief valve is reached, this valve will start to open and the pilot flow will result in a differential pressure over the compensator spool, which causes this spool to shift and brings the pump to a smaller displacement  $V_{g\ min}$ .

Upon reaching the set pressure control level (set pressure at pilot relief valve plus differential pressure at pressure control compensator) the pump will go over to the pressure control mode.

The differential pressure at the pressure compensator spool (item 1) is normally set at 25 bar, which results in a pilot flow at  $X_3$  of approx. 2 L/min.

In case another setting (range 14 to 50 bar) is required, please state in clear text when ordering.

As a sepearte pilot relief valve we recommend:

DBD 6 (hydraulic) see

DBETR-SO 437 with dampened spool (electric)

The max. line lenght should not exceed 2 m.

**Note**

- The beginning of control and the DRG control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic.
- Standby operation see page 6.

## LRDH with hydraulic stroke limitation

**Initial position:**  $V_{g\ max}$  in pressureless condition

The hydraulic stroke limitation is used for infinite adjustment of the displacement from  $V_{g\ max}$  bis  $V_{g\ min}$ .

It is overridden by the power control.

The displacement is set by the pilot pressure applied at port  $X_1$

Maximum permissible pilot pressure \_\_\_\_\_ 100 bar

The hydraulic stroke limitation takes the required control pressure from the pump output pressure. It must be noted, that the pump operating pressure must be at least 40 bar.

If the pressure is lower, the pump must be supplied with an external control pressure of at least 40 bar into port  $X_2$ .

The control begin is adjustable.

**Control begin (bar), please state in clear test when ordering.**

### Note

- The control begin and the LRDH-control characteristic are influenced by pump inlet pressure. An increase in pump inlet pressure results in a higher control begin (see page 5) and thus a parallel shift of the control characteristic.

## LRDN with hydraulic stroke limitation

**Initial position:**  $V_{g\ min}$  in pressureless condition

The hydraulic stroke limitation is used for infinite adjustment of the displacement from  $V_{g\ min}$  to  $V_{g\ max}$ .

It is overridden by the power control.

Displacement is set by the pilot pressure applied at port  $X_1$ .

Maximum permissible pilot pressure  $p$  \_\_\_\_\_ 100 bar

A minimum pressure of 40 bar is required for hydraulic stroke limitation. The necessary control fluid is taken from the pump outlet pressure side.

An external control pressure is not required when the operating pressure  $> 40$  bar and  $V_{g\ min} > 0$ . In this case the port  $X_2$  must be plugged prior to commissioning. Otherwise an external control pressure source of at least 40 bar must be connected to port  $X_2$ .

The control begin is adjustable.

**Control begin (bar), please state in clear text when ordering.**

### Note

- The control begin and the LRDN-control characteristic are influenced by pump inlet pressure. An increase in pump inlet pressure results in a higher control begin (see page 5) and thus a parallel shift of the control characteristic.

# HD.b Hydraulic control, pilot pressure dependent

**Initial position:**  $V_{g\ min}$  in pressureless condition

The hydraulic pilot pressure dependent control enables an infinite adjustment of the pump displacement in accordance with the applied pilot pressure signal. The displacement setting is proportional to the pilot pressure in port  $X_1$ .

A minimum control pressure of 40 bar is required. The necessary control fluid is taken from the pump outlet pressure side.

An external control pressure is not required when the operating pressure  $> 40$  bar and  $V_{g\ min} > 0$ . In this case the port  $X_2$  must be plugged prior to commissioning. Otherwise an external control pressure of at least 40 bar must be connected to port  $X_2$ .

Maximum permissible pilot pressure  $p_{St}$  \_\_\_\_\_ 100 bar

The control begin is adjustable.

**Control begin (bar), please state in clear text when ordering.**

**Note**

- The beginning of control and the HD control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic.

**Integrated pressure control is standard.** Description see page 37

**Note**

**The spring return feature in the control unit is not a safety device**

The spool valve inside the control unit can get stuck in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the axial piston unit can no longer supply the flow specified by the operator.

Check whether your application requires that remedial measures be taken on your machine in order to bring the driven consumer into a safe position (e.g. immediate stop).

## HD.D with integrated pressure control

**Initial position:**  $V_{g\ min}$  in pressureless condition

The pressure control overrides the HD-function i.e. below the setting of the pressure control the HD-function can be operated

It protects the pump against excessive pressure and subsequent damage.

The pressure control valve is integrated into the port plate and can be set externally.

Upon reaching the set pressure control level the pump will swivel towards a lower displacement.

**Setting range of the pressure control** \_\_\_\_\_ 50 to 350 bar  
Standard setting at 350 bar.

If a different setting is required, please state in clear text.

A recommended main line relief valve in the system to safeguard against excessive pressure spikes must have a cracking pressure at least 20 bar above the pressure control setting.

### Note

- The beginning of control and the pressure control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic
- Standby operation see page 6.

### Characteristic

### Schematic

Hydraulic control, pilot pressure dependent with integrated pressure control

### Sub assemblies

- 1 Pressure control
- 6 HD-Pilot valve

### Ports for

- $X_1$  Pilot pressure
- $X_2$  External control pressure
- M Measuring pressure on control piston (plugged)

Dimensions see page 39

# HD.G with remotely adjustable pressure control

**Initial position:**  $V_{g\ min}$  in pressureless condition

The pressure control overrides the HD function.

In order to obtain a remote adjustment of the pressure control level a separate pilot pressure relief (item 2) valve must be connected to port  $X_3$ . This relief valve is not included in the supply of the DRG control.

Setting range of the pressure control \_\_\_\_\_ 50 to 350 bar

The spring force on the pressure compensator spool causes a differential pressure between pump output pressure and pressure at  $X_3$  (as soon as the relief valve opens and the pressure control function takes place). Standard setting of this differential pressure 25 bar.

As long as the the pressure is below the set pressure of the relief valve, the pressures on both sides of the pressure compensator spool are equal and the additional spring force keeps this spool in a shifted position (Spool in equilibrium).

As soon as the set pressure of the relief valve is reached, this valve will start to open and the pilot flow will result in a differential pressure over the compensator spool, which causes this spool to shift and brings the pump to a smaller displacement  $V_{g\ min}$ .

Upon reaching the set pressure control level (set pressure at pilot relief valve plus differential pressure at pressure control compensator) the pump will go over to the pressure control mode.

The differential pressure at the pressure compensator spool (item 1) is normally set at 25 bar, which results in a pilot flow at  $X_3$  of approx. 2 L/min.

In case another setting (range 14 to 50 bar) is required, please state in clear text when ordering.

As a separate pilot relief valve we recommend:

DBD 6 (hydraulic) see

DBETR-SO 437 with dampened spool (electric)

The max. line length should not exceed 2 m.

**Note**

- The beginning of control and the pressure control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic.
- Standby operation see page 6.

**Characteristic**

**Schematic**

Hydraulic control, pilot pressure dependent with integrated pressure control

## EP.D Electric control with proportional valve

**Initial position:**  $V_{g \min}$  in pressureless condition

The electro-hydraulic control with proportional valve enables a stepless adjustment of the pump displacement dependent on an electric current signal.

The displacement is proportional to the current signal to the solenoid of a proportional pressure reducing valve DRE4K, i.e. an increasing current signal results in an increasing displacement.

A minimum control pressure of 40 bar is required. The necessary control fluid is taken from the pump outlet pressure side.

An external control pressure is not required when the operating pressure  $> 40$  bar and  $V_{g \min} > 0$ . In this case the port  $X_2$  must be plugged prior to commissioning. Otherwise an external control pressure of at least 40 bar must be connected to port  $X_2$ .

A pilot pressure of 30 bar is required at port P to actuate the proportional valve DRE4K.

### Pilot pressure at port P

Required  $p_{\min}$  \_\_\_\_\_ 30 bar  
 $p_{\max}$  \_\_\_\_\_ 100 bar

### Important

- The beginning of control and the pressure control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic.
- Type of protection proportional valve to IP65

### Technical data proportional-press. reducing valve

	EP1	EP2
Operating voltage (DC)	12V(±20%)	24V (±20%)
Control current		
Control begin at $V_{g \min}$	900 mA	450 mA
Control end at $V_{g \max}$	1400 mA	700 mA
Current limit	2,2 A	1,0 A
Nom. resistance (at 20°C)	2,4 $\Omega$	12 $\Omega$
Duty cycle	100 %	100 %
Type of protection (HIRSCHMANN) to DIN EN 60529	IP65	IP65

Various amplifiers for control of the proportional valve are available

**Integrated pressure control EP.D is standard** and overrides the EP function. Description see page 43.

### Note

#### The spring return feature in the control unit is not a safety device

The spool valve inside the control unit can get stuck in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the axial piston unit can no longer supply the flow specified by the operator.

Check whether your application requires that remedial measures be taken on your machine in order to bring the driven consumer into a safe position (e.g. immediate stop).

## EP.D Electric control with proportional valve

### Characteristic

### Schematic

Electric control with proportional pressure reducing valve

### Sub assemblies

- 1 Pressure control
- 7 Pilot valve
- 8 Proportional pressure reducing valve incl. conductor box (Hirschmann plug without suppressor diode) see page 50

### Ports for

- P Pilot pressure
- X<sub>2</sub> External control pressure
- M Measuring pressure on control piston (plugged)
- M<sub>St</sub> Measuring pilot pressure (plugged)

## EP.D with integrated pressure control

**Initial position:**  $V_{g\ min}$  in pressureless condition

The pressure control overrides the EP-function i.e. below the setting of the pressure control the EP-function can be operated.

It protects the pump against excessive pressure and subsequent damage.

The pressure control valve is integrated into the port plate and can be set externally.

Upon reaching the set pressure control level the pump will swivel towards a lower displacement.

**Setting range of the pressure control** \_\_\_\_\_ 50 to 350 bar  
Standard setting at 350 bar.

If a different setting is required, please state in clear text.

A recommended main line relief valve in the system to safeguard against excessive pressure spikes must have a cracking pressure at least 20 bar above the pressure control setting.

### Note

- The beginning of control and the pressure control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic
- Standby operation see page 6.

### Characteristic

### Schematic

Electric control with proportional pressure reducing valve

### Sub assemblies

- 1 Pressure control
- 7 Pilot valve
- 8 Proportional pressure reducing valve  
incl. conductor box (Hirschmann plug without suppressor diode) see page 46

### Ports for

- P Pilot pressure  
 $X_2$  External control pressure  
 M Measuring pressure on control piston (plugged)  
 $M_{St}$  Measuring pilot pressure (plugged)

Dimensions see page 45

## EP.G with remotely adjustable pressure control

**Initial position:**  $V_{g\ min}$  in pressureless condition

The pressure control overrides the EP- function.

In order to obtain a remote adjustment of the pressure control level a separate pilot pressure relief (item 2) valve must be connected to port  $X_3$ . This relief valve must be ordered separately to the DRG control.

Setting range of the pressure control \_\_\_\_\_ 50 to 350 bar

The spring force on the pressure compensator spool causes a differential pressure between pump output pressure and pressure at  $X_3$  (as soon as the relief valve opens and the pressure control function takes place). Standard setting of this differential pressure 25 bar.

As long as the the pressure is below the set pressure of the relief valve, the pressures on both sides of the pressure compensator spool are equal and the additional spring force keeps this spool in a shifted position (Spool in equilibrium).

As soon as the set pressure of the relief valve is reached, this valve will start to open and the pilot flow will result in a differential pressure over the compensator spool, which causes this spool to shift and brings the pump to a smaller displacement  $V_{g\ min}$ .

Upon reaching the set pressure control level (set pressure at pilot relief valve plus differential pressure at pressure control compensator) the pump will go over to the pressure control mode.

The differential pressure at the pressure compensator spool (item 1) is normally set at 25 bar, which results in a pilot flow at  $X_3$  of approx. 2 L/min.

In case another setting (range 14 to 50 bar) is required, please state in clear text when ordering.

As a separate pilot relief valve we recommend:

DBD 6 (hydraulic)

DBETR-SO 437 with dampened spool  
(electric)

The max. line length should not exceed 2 m.

### Note

- The beginning of control and the pressure control characteristic are influenced by housing pressure. An increase in housing pressure results in a higher beginning of control (see page 7) and thus a parallel shift of the control characteristic.
- Standby operation see page 6.

### Characteristic

### Schematic

Electric control with proportional pressure reducing valve and remotely adjustable pressure control

### Sub assemblies

- 1 Integrated pressure control compensator
- 2 Separate pressure relief valve (not in scope of supply)
- 7 Pilot valve
- 8 Proportional pressure reducing valve

### Ports for

- P Pilot pressure for proportional valve
- $X_2$  External control pressure
- $X_3$  Separate pressure relief valve (EPG)
- M Measuring pressure on control piston (plugged)
- $M_{St}$  Measuring pilot pressure (plugged)

# Visual swivel angle indicator

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

The swivel angle is indicated by a pin at the side of the port plate (the cap nut must be removed).

The protruding length of the pin varies in accordance with the position of the lens plate.

The pump is at zero if the pin is flush with the port plate.

The length of the pin is approx. 8 mm when swivelled to max. angle  $V_{g \max}$ .

## Schematic example LRD – initial position $V_{g \max}$

# Electric swivel angle indicator

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

In this case the pump swivel angle is indicated via an inductive position transducer.

It converts the displacement of the control device into an electrical signal. This signal can be used to feed the value of swivel angle to an amplifier card for example.

Inductive transducer Type IW9 – 03 – 01

# Installation instructions standard version

## General

During commissioning and operation the axial piston unit must be full with fluid at all times and must be deaerated. This is also important after prolonged periods of standstill since the system can empty itself via the hydraulic lines.

The leakage fluid in the housing must be drained to tank via the highest positioned case drain port.

Under all operating conditions the case drain line and the suction line inside the reservoir must be below the minimum fluid level.

The minimum inlet pressure at port S may not fall below 0.8 bar absolute.

## Installation position

See examples below. Further installation positions are possible, please consult us.

### Mounting below the reservoir (standard)

Pump below the minimum reservoir fluid level

Recommended installation position: 1 and 2

### Mounting above the reservoir

## Safety information

- The pump A7VO was designed for operation in open loop circuits
- Systems design, installation and commissioning requires trained technicians or tradesmen.
- All hydraulic ports can only be used for the fastening of hydraulic service lines.
- During and shortly after operation of a pump the housing and especially a solenoid can be extremely hot, avoid being burned; take suitable safety measures (wear protective clothing).
- Dependent on the operating conditions of the axial piston pump (operating pressure, fluid temperature) deviations in the performance curves can occur.
- Pressure ports:  
All materials and port threads are selected and designed in such a manner, that they can withstand the peak pressures.  
The machine and system manufacturer must ensure, that all connecting elements and hydraulic lines are suitable for the actual operating conditions (pressures, flow, fluid, temperature) in accordance with the necessary safety factors.
- All given data and information must be adhered to..
- The product has not been released as a component in the safety concept of a total machine system acc. to DIN EN ISO 13849.
- The following tightening torques are valid:
  - Female threads in the axial piston unit:  
the maximum permissible tightening torques  $M_{G\max}$  are maximum values for the female threads in the pump casting and may not be exceeded. For values see table below.
  - Fittings:  
please comply with the manufacturer's information regarding the max. permissible tightening torques for the used fittings.
  - Fastening bolts:  
for fastening bolts to DIN 13 we recommend to check the permissible tightening torques in each individual case to VDI 2230.
  - Plugs:  
for the metal plugs, supplied with the axial piston unit the following min. required tightening torques  $M_v$  apply (see table)

Port thread size		Max. perm. tightening torque in female threads $M_{G\max}$	Required tightening torque of plugs or fittings $M_v$	Across the flats in Allan screws
M14x1.5	DIN 3852	80 Nm	35 Nm	6 mm
M18x1.5	DIN 3852	140 Nm	60 Nm	8 mm
M22x1.5	DIN 3852	210 Nm	80 Nm	10 mm
M33x2	DIN 3852	540 Nm	225 Nm	17 mm
